1 Routine/Function Prologues

1.0.1 cvmix_driver

The stand-alone driver for the CVMix package. This driver reads in the cvmix_nml namelist to determine what type of mixing has been requested, and also reads in mixing-specific parameters from a mixingtype_nml namelist.

INTERFACE:

```
Program cvmix_driver
```

USES:

```
   use cvmix_kinds_and_types, only : cvmix_r8, &
                                     cvmix_strlen
```

1.0.2 cvmix_BL_pointer_driver

A routine to test the Bryan-Lewis implementation of static background mixing. Inputs are BL coefficients in two columns, one that represents tropical latitudes and one that represents subtropical latitudes. All memory is declared in the driver, and the CVMix data type points to the local variables.

INTERFACE:

```
Subroutine cvmix_BL_pointer_driver(nlev, ocn_depth)
```

USES:

```
  use cvmix_kinds_and_types, only : cvmix_r8,                &
                                    cvmix_data_type,         &
                                    cvmix_global_params_type
  use cvmix_background,      only : cvmix_init_bkgnd,        &
                                    cvmix_coeffs_bkgnd
  use cvmix_put_get,         only : cvmix_put
  use cvmix_io,              only : cvmix_io_open,           &
                                    cvmix_output_write,      &
#ifdef _NETCDF
                                    cvmix_output_write_att,  &
#endif
                                    cvmix_io_close

  Implicit None
```

INPUT PARAMETERS:

```
  integer, intent(in)        :: nlev        ! number of levels for column
  real(cvmix_r8), intent(in) :: ocn_depth   ! Depth of ocn
```

1.0.3 cvmix_BL_memcopy_driver

A routine to test the Bryan-Lewis implementation of static background mixing. Inputs are BL coefficients in two columns, one that represents tropical latitudes and one that represents subtropical latitudes. All memory is declared in the driver and then copied into the CVMix data structures.

INTERFACE:

```
Subroutine cvmix_BL_memcopy_driver(nlev, ocn_depth)
```

USES:

```
  use cvmix_kinds_and_types, only : cvmix_r8,                &
                                    cvmix_data_type,         &
                                    cvmix_global_params_type
  use cvmix_background,      only : cvmix_init_bkgnd,        &
                                    cvmix_coeffs_bkgnd,      &
                                    cvmix_get_bkgnd_real_2D, &

#endif
                                    cvmix_io_close

  Implicit None
```

INPUT PARAMETERS:

```
  integer, intent(in)        :: nlev        ! number of levels for column
  real(cvmix_r8), intent(in) :: ocn_depth   ! Depth of ocn
```

1.0.4 cvmix_shear_driver

A routine to test the Large, et al., implementation of shear mixing. Inputs are the coefficients used in Equation (28) of the paper. The diffusivity coefficient is output from a single column to allow recreation of the paper's Figure 3. Note that here each "level" of the column denotes a different local gradient Richardson number rather than a physical ocean level. All memory is declared in the driver, and the CVMix data type points to the local variables.

INTERFACE:

```
 Subroutine cvmix_shear_driver(nlev)
```

USES:

```
   use cvmix_kinds_and_types, only : cvmix_r8,                 &
                                     cvmix_zero,               &
                                     cvmix_one,                &

1.1 Fortran: Module Interface cvmix_io

This module contains routines to read CVmix variables from data files or output CVmix variables to data files. Currently only ascii and netCDF output are supported, as well as netCDF input, but the plan is to also include plain binary input / output as well.

USES:

```
    use cvmix_kinds_and_types, only : cvmix_data_type, &
                                      cvmix_r8,        &
                                      cvmix_strlen
    use cvmix_utils,           only : cvmix_att_name

1.1.1 cvmix_io_open

INTERFACE:

```
subroutine cvmix_io_open(file_id, file_name, file_format, read_only)
```

DESCRIPTION:

Routine to open a file for reading and / or writing. The goal is to support plain text (currently working for writing only), netCDF (working for both reading and writing), and plain binary (not supported at this time). Besides opening the file, this routine also adds an entry to file_database, a linked list that keeps track of what files are open and what type of file each identifier refers to. So it will be possible to output the same data in ascii and netCDF, for example.

USES:

```
Only those used by entire module.
```

INPUT PARAMETERS:

```
character(len=*),  intent(in) :: file_name, file_format
logical, optional, intent(in) :: read_only
```

OUTPUT PARAMETERS:

```

1.3 Fortran: Module Interface cvmix_background

AUTHOR:

Michael N. Levy, NCAR (mlevy@ucar.edu)

DESCRIPTION:

This module contains routines to initialize the derived types needed for time independent static background mixing coefficients. It specifies either a scalar, 1D, or 2D field for viscosity and diffusivity. It also calculates the background diffusivity using the Bryan-Lewis method. It then sets the viscosity and diffusivity to the specified value.

```

DESCRIPTION:

Initialization routine for Bryan-Lewis diffusivity/viscosity calculation. For each column, this routine sets the static viscosity & diffusivity based on the specified parameters. Note that the units of these parameters must be consistent with the units of viscosity and diffusivity – either cgs or mks, but do not mix and match!

The Bryan-Lewis parameterization is based on the following:

$$\begin{aligned} \kappa_{BL} &= \text{bl1} + \frac{\text{bl2}}{\pi} \tan^{-1}\left(\text{bl3}(|z| - \text{bl4})\right) \\ \nu_{BL} &= \text{Pr} \cdot \kappa_{BL} \end{aligned}$$

This method is based on the following paper:

A Water Mass Model of the World Ocean
K. Bryan and L. J. Lewis
Journal of Geophysical Research, vol 84 (1979), pages 2503-2517.

In that paper, they recommend the parameters

$\text{bl1} = 8 \cdot 10^{-5}$ m^2/s

$\text{bl2} = 1.05 \cdot 10^{-4}$ m^2/s

$\text{bl3} = 4.5 \cdot 10^{-3}$ m^{-1}

$\text{bl4} = 2500$ m

However, more recent usage of their scheme may warrant different settings. **USES:**

```
Only those used by entire module.

1.4.1 cvmix_init_shear

INTERFACE:

```
  subroutine cvmix_init_shear(CVmix_shear_params_user, mix_scheme,           &

                              KPP_Ri_zero, KPP_exp, old_vals)
```

DESCRIPTION:

Initialization routine for shear (Richardson number-based) mixing. There are currently two supported schemes - set `mix_scheme = 'PP'` to use the Pacanowski-Philander mixing scheme or set `mix_scheme = 'KPP'` to use the interior mixing scheme laid out in Large et al.

PP requires setting ν_0 (`PP_nu_zero` in this routine), *alpha* (`PP_alpha`), and n (`PP_exp`), and returns

$$\begin{aligned} \nu_{PP} &= \frac{\nu_0}{(1+\alpha \mathrm{Ri})^n} + \nu_b \\ \kappa_{PP} &= \frac{\nu}{1+\alpha \mathrm{Ri}} + \kappa_b \end{aligned}$$

Note that ν_b and κ_b are set in `cvmix_init_bkgnd()`, which needs to be called separately from this routine.

KPP requires setting ν^0 (`KPP_nu_zero`, Ri_0(`KPP_Ri_zero`), and p_1 (`KPP_exp`), and returns

$$\nu_{KPP} = \begin{cases} \nu^0 & \mathrm{Ri} < 0 \\ \nu^0 \left[1 - \frac{\mathrm{Ri}}{\mathrm{Ri}_0}^2\right]^{p_1} & 0 < \mathrm{Ri} < \mathrm{Ri}_0 \\ 0 & \mathrm{Ri}_0 < \mathrm{Ri} \end{cases}$$

                            kappa_ddiff_param2, kappa_ddiff_param3, old_vals)
```

DESCRIPTION:

Initialization routine for double diffusion mixing. This mixing technique looks for two unstable cases in a column - salty water over fresher water and colder water over warmer water - and computes different diffusivity coefficients in each of these two locations. The parameter

$$R_\rho = \frac{\alpha(\partial\Theta/\partial z)}{\beta(\partial S/\partial z)}$$

to determine as a stratification parameter. If $(\partial S/\partial z)$ is positive and $1 < R_\rho < R_\rho^0$ then salt water sits on top of fresh water and the diffusivity is given by

$$\kappa = \kappa^0 \left[1 - \left(\frac{R_\rho - 1}{R_\rho^0 - 1}\right)^{p_1}\right]^{p_2}$$

By default, $R_\rho^0 = 2.55$, but that can be changed by setting `strat_param_max` in the code. Similarly, by default $p_1 = 1$ (`ddiff_exp1`), $p_2 = 3$ (`ddiff_exp2`), and

$$\kappa^0 = \begin{cases} 7 \cdot 10^{-5} \text{ m}^2/\text{s} & \text{for temperature (\texttt{kappa\_ddiff\_t} in this routine)} \\ 10^{-4} \text{ m}^2/\text{s} & \text{for salinity and other tracers (\texttt{kappa\_ddiff\_s} in this routine).} \end{cases}$$

On the other hand, if $(\partial\Theta/\partial z)$ is negative and $0 < R_\rho < 1$ then cold water sits on warm warm water and the diffusivity for temperature is given by

$$\kappa = \nu_{\text{molecular}} \cdot 0.909 \exp\left\{4.6 \exp\left[-0.54\left(\frac{1}{R_\rho} - 1\right)\right]\right\}$$

where $\nu_{\text{molecular}}$ Is the molecular viscosity of water. By default it is set to $1.5 \cdot 10^{-6}$ m^2/s, but it can be changed through `mol_diff` in the code. Similarly, 0.909, 4.6, and -0.54 are the default values of `kappa_ddiff_param1`, `kappa_ddiff_param2`, and `kappa_ddiff_param3`, respectively.

For salinity and other tracers, κ above is multiplied by the factor

$$\text{factor} = \begin{cases} 0.15 R_\rho & R_\rho < 0.5 \\ 1.85 R_\rho - 0.85 & 0.5 \le R_\rho < 1 \end{cases}$$

κ is stored in `CVmix_vars%diff_iface(:,1)`, while the modified value for non-temperature tracers is stored in `CVmix_vars%diff_iface(:,2)`. Note that CVMix assumes units are —'mks'—.

```

DESCRIPTION:

Computes the index of the level and interface above OBL_depth. The index is stored as a real number, and the integer index can be solved for in the following way:
`kt` = index of cell center above OBL_depth = `nint(kOBL_depth)-1` `kw` = index of interface above OBL_depth = `floor(kOBL_depth)`

USES:

```
Only those used by entire module.
```

INPUT PARAMETERS:

1.7.10 cvmix_kpp_compute_enhanced_diff

INTERFACE:

```
subroutine cvmix_kpp_compute_enhanced_diff(Mdiff_ktup, Tdiff_ktup,          &
                                           Sdiff_ktup, Mdiff, Tdiff, Sdiff, &
                                           OBL_Mdiff, OBL_Tdiff, OBL_Sdiff, &
                                           delta, lkteqkw)
```

DESCRIPTION:

The enhanced mixing described in Appendix D of LMD94 changes the diffusivity values at the interface between the cell center above OBL_depth and the one below it, based on a weighted average of how close to each center OBL_depth is. Note that we need to know whether OBL_depth is above this interface or below it - we do this by comparing the indexes of the cell center above OBL_depth (ktup) and the cell interface above OBL_depth(kwup).

INPUT PARAMETERS:

```
! Diffusivity and viscosity at cell center above OBL_depth
real(cvmix_r8), intent(in) :: Mdiff_ktup, Tdiff_ktup, Sdiff_ktup

! Weight to use in averaging (distance between OBL_depth and cell center
! above OBL_depth divided by distance between cell centers bracketing
! OBL_depth).
real(cvmix_r8), intent(in) :: delta

logical, intent(in) :: lkteqkw ! .true.  => interface ktup+1 is outside OBL
                               !            (update diff and visc)
                               ! .false. => interface ktup+1 is inside OBL

! of lkteqkw
real(cvmix_r8), intent(inout) :: Mdiff, Tdiff, Sdiff,                    &

INTERFACE:

```
subroutine cvmix_kpp_compute_turbulent_scales_1d(sigma_coord, OBL_depth,    &
                                                 surf_buoy_force,           &
                                                 surf_fric_vel, w_m, w_s,   &
                                                 CVmix_kpp_params_user)
```

DESCRIPTION:

Computes the turbulent velocity scales for momentum (`w_m`) and scalars (`w_s`) given a 1d array of σ coordinates. Note that the turbulent scales are a continuous function, so there is no restriction to only evaluating this routine at interfaces or cell centers. Also, if $\sigma >$ `surf_layer_ext` (which is typically 0.1), `w_m` and `w_s` will be evaluated at the latter value.

USES:

```
Only those used by entire module.
```

INPUT PARAMETERS:

```
real(cvmix_r8), dimension(:), intent(in) :: sigma_coord
real(cvmix_r8), intent(in) :: OBL_depth, surf_buoy_force, surf_fric_vel
type(cvmix_kpp_params_type), intent(in), optional, target ::              &

1.7.16 cvmix_kpp_compute_unresolved_shear

INTERFACE:

```
function cvmix_kpp_compute_unresolved_shear(zt_cntr, ws_cntr, N_iface,      &
                                         Nsqr_iface, CVmix_kpp_params_user)
```

DESCRIPTION:

Computes the square of the unresolved shear (V_t^2 in Eq. (23) of LMD94) at cell centers. Note that you must provide either the buoyancy frequency or its square at cell interfaces, this routine by default will use the lower cell interface value as the cell center, but you can instead take an average of the top and bottom interface values by setting lavg_N_or_Nsqr = .true. in cvmix_kpp_init(). If you pass in Nsqr then negative values are assumed to be zero (default POP behavior).

USES:

```
Only those used by entire module.
```

INPUT PARAMETERS:

```
! zt_cntr: height at center of cell (units: m)
! ws_cntr: w_s (turbulent scale factor) at center of cell (units: m/s)

1.7.17 cvmix_kpp_compute_shape_function_coeffs

INTERFACE:

```
subroutine cvmix_kpp_compute_shape_function_coeffs(GAT1, DGAT1, coeffs)
```

DESCRIPTION:

Computes the coefficients of the shape function $G(\sigma) = a_0 + a_1\sigma + a_2\sigma^2 + a_3\sigma^3$, where

$$\begin{aligned} a_0 &= 0 \\ a_1 &= 1 \\ a_2 &= 3G(1) - G'(1) - 2 \\ a_3 &= -2G(1) + G'(1) + 1 \end{aligned}$$

Note that $G(1)$ and $G'(1)$ come from Eq. (18) in Large, et al., and this routine returns coeffs(1:4) = $(/a_0, a_1, a_2, a_3/)$

AUTHOR:

Michael N. Levy, NCAR (mlevy@ucar.edu)

1.9.1 cvmix_math_poly_interp

INTERFACE:

```
subroutine cvmix_math_poly_interp(coeffs, interp_type, x, y, x0, y0)
```

DESCRIPTION:

Given (x(1), y(1)), (x(2), y(2)), and possibly (x0, y0), compute coeffs = $(/a_0, a_1, a_2, a_3/)$ such that, for $f(x) = \sum a_n x^n$, the following hold: $f(x(1)) = y(1)$ and $f(x(2)) = y(2)$. For

both quadratic and cubic interpolation, $f'(x(1)) = (y(1) - y0)/(x(1) - x0)$ as well, and for cubic splines $f'(x(2)) = (y(2) - y(1))/(x(2) - x(1))$.

AUTHOR:

Michael N. Levy, NCAR (mlevy@ucar.edu)
