1 Module Main Program (Stand-Alone)

1.0.1 cvmix_driver (Source File: cvmix_driver.F90)

The stand-alone driver for the CVMix package. This reads in the `cvmix.nml` namelist to determine what type of mixing has been requested, and also reads in mixing-specific parameters from a `mixingtype.nml` namelist.

INTERFACE

USES

```
use cvmix_kinds_and_types, only : cvmix_r8,           &
                                cvmix_zero,          &
                                cvmix_strlen
```

1.0.2 cvmix_BL_driver (Source File: cvmix_bgrnd_BL.F90)

A routine to test the Bryan-Lewis implementation of background mixing. Inputs are BL coefficients in two columns, one that represents tropical latitudes and one that represents subtropical latitudes. All memory is declared in the driver, and the CVMix data type points to the local variables.

INTERFACE

Subroutine cvmix_BL_driver(nlev, max_nlev, ocn_depth)

USES

[illegible]

INPUT PARAMETERS

```
integer, intent(in)      :: nlev,          &! number of levels for column
                           max_nlev        ! number of columns in memory
real(cvmix_r8), intent(in) :: ocn_depth    ! Depth of ocn
```

1.0.3 cvmix_shear_driver (Source File: cvmix_shear_drv.F90)

A routine to test the Large, et al., implementation of mixing. Inputs are the coefficients used in Equation (28) of the paper. The diffusivity coefficient is output from a single column to allow recreation of the paper's Figure 3. Note that here each "level" of the column denotes a different local gradient Richardson number rather than a physical ocean level. All memory is declared in the driver, and the CVMix data type points to the local variables.

INTERFACE

```
Subroutine cvmix_shear_driver(nlev, max_nlev)
```

USES

```
use cvmix_kinds_and_types, only : cvmix_r8,          &
                                   cvmix_zero,         &
                                   cvmix_one,          &
                                   cvmix_data_type
use cvmix_shear,                  only : cvmix_init_shear, &

#endif
                                   cvmix_io_close

implicit none
```

INPUT PARAMETERS

```
integer, intent(in) :: nlev,          &! number of levels for column
                           max_nlev        ! number of columns in memory
```

1.0.4 cvmix_tidal_driver (Source File: cvmix_tidal_Simmons.F90)

A routine to test the Simmons implementation of tidal

INTERFACE

Subroutine cvmix_tidal_driver()

USES

```

    use cvmix_kinds_and_types, only : cvmix_r8,           &

1.0.5 cvmix_ddiff_driver (Source File: cvmix_ddiff_drv.F90)

A routine to test the double diffusion mixing

INTERFACE

Subroutine cvmix_ddiff_driver(nlev, max_nlev)

USES

```

    use cvmix_kinds_and_types, only : cvmix_r8,           &

2 Module cvmix_io

This module contains routines to read CVmix variables from data files or output CVmix variables to data files. Currently only ascii and netCDF output are supported, as well as netCDF input, but the plan is to also include plain binary input / output as well.

USES

```

    use cvmix_kinds_and_types, only : cvmix_data_type,      &
                                     cvmix_r8,               &
                                     cvmix_zero,            &
                                     cvmix_strlen
    use cvmix_utils,              only : cvmix_att_name
#ifdef _NETCDF
    use netcdf
#endif

```

2.1 cvmix_io_open

INTERFACE

```

subroutine cvmix_io_open(file_id, file_name, file_format, read_only)

```

DESCRIPTION:

Routine to open a file for reading and / or writing. The goal is to support plain text (currently working for writing only), netCDF (working for both reading and writing), and plain binary (not supported at this time). Besides opening the file, this routine also adds an entry to file_database, a linked list that keeps track of what files are open and what type of file each identifier refers to. So it will be possible to output the same data in ascii and netCDF, for example.

USES

Only those used by entire module.

INPUT PARAMETERS

```

character(len=*), intent(in) :: file_name, file_format
logical, optional, intent(in) :: read_only

```

OUTPUT PARAMETERS

```
integer, intent(out) :: file_id
```

LOCAL VARIABLES

```
type(cvmix_file_entry), pointer :: file_index
logical                      :: readonly
```

2.2 cvmix_input_read_1d_double

INTERFACE

```
subroutine cvmix_input_read_1d_double(file_id, var_name, local_copy)
```

DESCRIPTION:

Routine to read the requested 1D variable from a netcdf file and save it to a local array (file must be opened using `cvmix_io_open` with the optional argument `readonly = .true.`). Called with `cvmix_input_read` (see interface in PUBLIC MEMBER FUNCTIONS above). At this time, only works with netcdf files.

USES

Only those used by entire module.

INPUT PARAMETERS

```
integer,          intent(in)  :: file_id
character(len=*), intent(in)  :: var_name
real(cvmix_r8), dimension(:), intent(out) :: local_copy

```

2.3 cvmix_input_read_2d_integer

INTERFACE

```
subroutine cvmix_input_read_2d_integer(file_id, var_name, local_copy)
```

DESCRIPTION:

Routine to read the requested 2D variable from a netcdf file and save it to a local array (file must be opened using `cvmix_io_open` with the optional argument `readonly = .true.`). Called with `cvmix_input_read` (see interface in PUBLIC MEMBER FUNCTIONS above). At this time, only works with netcdf files.

USES

Only those used by entire module.

INPUT PARAMETERS

2.4 cvmix_input_read_2d_double

INTERFACE

```
subroutine cvmix_input_read_2d_double(file_id, var_name, local_copy)
```

DESCRIPTION:

Routine to read the requested 2D variable from a netcdf file and save it to a local array (file must be opened using `cvmix_io_open` with the optional argument `readonly = .true.`). Called with `cvmix_input_read` (see interface in PUBLIC MEMBER FUNCTIONS above). At this time, only works with netcdf files.

USES

Only those used by entire module.

INPUT PARAMETERS

                                     buoyancy_cntr)
```

DESCRIPTION:

Routine to write the requested variables from a single column to a file (file must be opened using `cvmix_io_open` to ensure it is written correctly). Called with `cvmix_output_write` (see interface in PUBLIC MEMBER FUNCTIONS above).

USES

Only those used by entire module.

INPUT PARAMETERS

2.7 cvmix_output_write_multi_col

INTERFACE

```
subroutine cvmix_output_write_multi_col(file_id, CVmix_vars, var_names)
```

DESCRIPTION:

Routine to write the requested variables from multiple columns to a file (file must be opened using `vmix_output_open` to ensure it is written correctly). Called with `vmix_output_write` (see interface in PUBLIC MEMBER FUNCTIONS above).

USES

Only those used by entire module.

INPUT PARAMETERS

```
integer,                                intent(in) :: file_id
type(cvmix_data_type), dimension(:), intent(in) :: CVmix_vars
character(len=*),      dimension(:), intent(in) :: var_names
```

LOCAL VARIABLES

```
integer :: nlev, ncol, icol, kw, var
logical :: z_err

2.8 cvmix_write_2d_double

INTERFACE

```
subroutine cvmix_output_write_2d_double(file_id, var_name, dim_names,      &
                                         field, FillVal)
```

DESCRIPTION:

Routine to write a 2d field to a netcdf file. Called with `cvmix_output_write` (see interface in PUBLIC MEMBER FUNCTIONS above).

USES

Only those used by entire module.

INPUT PARAMETERS

```
integer,                                intent(in) :: file_id

                                         var_name)
```

DESCRIPTION:

Routine to write an attribute with an integer value to a netcdf file. If `var_name` is omitted, routine writes a global attribute. Called with `cvmix_output_write_att` (see interface in PUBLIC MEMBER FUNCTIONS above).

USES

Only those used by entire module.

INPUT PARAMETERS

```
integer,          intent(in)           :: file_id

2.11 cvmix_write_att_real

INTERFACE

```
subroutine cvmix_output_write_att_real(file_id, att_name, att_val, var_name)
```

DESCRIPTION:

Routine to write an attribute with a real value to a netcdf file. If `var_name` is omitted, routine writes a global attribute. Called with `cvmix_output_write_att` (see interface in PUBLIC MEMBER FUNCTIONS above).

USES

Only those used by entire module.

INPUT PARAMETERS

```

integer,          intent(in)          :: file_id
character(len=*), intent(in)          :: att_name
real(cvmix_r8),   intent(in)          :: att_val

2.12 cvmix_write_att_string

INTERFACE

```

subroutine cvmix_output_write_att_string(file_id, att_name, att_val, var_name)

```

DESCRIPTION:

Routine to write an attribute with a string value to a netcdf file. If var_name is omitted, routine writes a global attribute. Called with cvmix_output_write_att (see interface in PUBLIC MEMBER FUNCTIONS above).

USES

Only those used by entire module.

INPUT PARAMETERS

```

integer,          intent(in)          :: file_id

2.13 cvmix_io_close

INTERFACE

```
subroutine cvmix_io_close(file_id)
```

DESCRIPTION:

Routine to close a file once all writing has been completed. In addition to closing the file, this routine also deletes its entry in file_database to avoid trying to write to the file in the future.

USES

Only those used by entire module.

INPUT PARAMETERS

```
integer, intent(in) :: file_id
```

LOCAL VARIABLES

```
type(cvmix_file_entry), pointer :: ifile, file_to_close

```

2.14 cvmix_io_close_all

INTERFACE

```
subroutine cvmix_io_close_all
```

DESCRIPTION:

Routine to close all files open (meant to be called prior to an abort)

USES

Only those used by entire module.

LOCAL VARIABLES

```
integer :: fid
```

2.15 get_file_name

INTERFACE

```
function get_file_name(file_id)
```

DESCRIPTION:

Returns the name of the file associated with a given file_id. If the file is not in the database, returns FILE_NOT_FOUND.

USES

Only those used by entire module.

INPUT PARAMETERS

```
integer, intent(in) :: file_id
```

OUTPUT PARAMETERS

```
character(len=cvmix_strlen) :: get_file_name

2.16 get_file_type

INTERFACE

```
function get_file_type(file_id)
```

DESCRIPTION:

Returns the file format (enumerated in DEFINED PARAMETERS section) of a given file. If the file is not in the database, returns FILE_NOT_FOUND.

USES

Only those used by entire module.

INPUT PARAMETERS

```
integer, intent(in) :: file_id

2.17 cvmix_input_get_netcdf_dim

INTERFACE

```
function cvmix_input_get_netcdf_dim(file_id, dim_name)
```

DESCRIPTION:

Returns the value of the dimension `dim_name` in the netcdf file `file_id`. If the dimension does not exist, returns -1.

USES

Only those used by entire module.

INPUT PARAMETERS

```
integer,          intent(in) :: file_id
character(len=*), intent(in) :: dim_name
```

OUTPUT PARAMETERS

```
integer                                :: cvmix_input_get_netcdf_dim

```

2.18 get_netcdf_varid

INTERFACE

```
function get_netcdf_varid(file_id, var_name, xtype, ndims)
```

DESCRIPTION:

Returns the varid associated with the variable `var_name` in the netcdf file `file_id`. If the variable does not exist, returns -1.

USES

Only those used by entire module.

INPUT PARAMETERS

```
integer,          intent(in) :: file_id
character(len=*), intent(in) :: var_name

4 Module `cvmix_background`

AUTHOR

Michael N. Levy, NCAR (mlevy@ucar.edu)

DESCRIPTION:

This module contains routines to initialize the derived types needed for time independent static background mixing coefficients. It specifies either a scalar, 1D, or 2D field for viscosity and diffusivity. It also calculates the background diffusivity using the Bryan-Lewis method. It then sets the viscosity and diffusivity to the specified value.

```

DESCRIPTION:

Initialization routine for Bryan-Lewis diffusivity/viscosity calculation. For each column, this routine sets the static viscosity & diffusivity based on the specified parameters. Note that the units of these parameters must be consistent with the units of viscosity and diffusivity – either cgs or mks, but do not mix and match!

The Bryan-Lewis parameterization is based on the following:

$$\begin{aligned}\kappa_{BL} &= bl1 + \frac{bl2}{\pi} \tan^{-1} \left(bl3(|z| - bl4) \right) \\ \nu_{BL} &= Pr \cdot \kappa_{BL}\end{aligned}$$

This method is based on the following paper:

A Water Mass Model of the World Ocean
K. Bryan and L. J. Lewis
Journal of Geophysical Research, vol 84 (1979), pages 2503-2517.

In that paper, they recommend the parameters

$$bl1 = 8 \cdot 10^{-5} \text{ m}^2/\text{s}$$

$$bl2 = 1.05 \cdot 10^{-4} \text{ m}^2/\text{s}$$

$$bl3 = 4.5 \cdot 10^{-3} \text{ m}^{-1}$$

$$bl4 = 2500 \text{ m}$$

However, more recent usage of their scheme may warrant different settings.

USES

Only those used by entire module.

```

DESCRIPTION:

Initialization routine for double diffusion mixing. This mixing technique looks for two unstable cases in a column - salty water over fresher water and colder water over warmer water - and computes different diffusivity coefficients in each of these two locations. The parameter

$$R_\rho = \frac{\alpha(\partial\Theta/\partial z)}{\beta(\partial S/\partial z)}$$

to determine as a stratification parameter. If $(\partial S/\partial z)$ is positive and $1 < R_\rho < R_\rho^0$ then salt water sits on top of fresh water and the diffusivity is given by

$$\kappa = \kappa^0 \left[1 - \left(\frac{R_\rho - 1}{R_\rho^0 - 1} \right)^{p_1} \right]^{p_2}$$

By default, $R_\rho^0 = 2.55$, but that can be changed by setting `strat_param_max` in the code. Similarly, by default $p_1 = 1$ (`ddiff_exp1`), $p_2 = 3$ (`ddiff_exp2`), and

$$\kappa^0 = \begin{cases} 7 \cdot 10^{-5} \text{ m}^2/\text{s} & \text{for temperature (0.7} \cdot \text{kappa_ddiff_s in this routine)} \\ 10^{-4} \text{ m}^2/\text{s} & \text{for salinity and other tracers (kappa_ddiff_s in this routine).} \end{cases}$$

On the other hand, if $(\partial\Theta/\partial z)$ is negative and $0 < R_\rho < 1$ then cold water sits on warm water and the diffusivity for temperature is given by

$$\kappa = \nu_{\text{molecular}} \cdot 0.909 \exp \left\{ 4.6 \exp \left[-0.54 \left(\frac{1}{R_\rho} - 1 \right) \right] \right\}$$

where $\nu_{\text{molecular}}$ is the molecular viscosity of water. By default it is set to $1.5 \cdot 10^{-6} \text{ m}^2/\text{s}$, but it can be changed through `mol_diff` in the code. Similarly, 0.909, 4.6, and -0.54 are the default values of `kappa_ddiff_param1`, `kappa_ddiff_param2`, and `kappa_ddiff_param3`, respectively.

For salinity and other tracers, κ above is multiplied by the factor

$$\text{factor} = \begin{cases} 0.15R_\rho & R_\rho < 0.5 \\ 1.85R_\rho - 0.85 & 0.5 \leq R_\rho < 1 \end{cases}$$

κ is stored in `CVmix_vars%diff_iface(:,1)`, while the modified value for non-temperature tracers is stored in `CVmix_vars%diff_iface(:,2)`. Note that CVMix assumes units are —'mks'—.

8 Module `cvmix_kpp`

AUTHOR

Michael N. Levy, NCAR (mlevy@ucar.edu)

DESCRIPTION:

This module contains routines to initialize the derived types needed for KPP mixing and to set the viscosity and diffusivity coefficients accordingly.

DESCRIPTION:

The enhanced mixing described in Appendix D of LMD94 changes the diffusivity values at the interface between the cell center above OBL_depth and the one below it, based on a weighted average of how close to each center OBL_depth is. Note that we need to know whether OBL_depth is above this interface or below it - we do this by comparing the indexes of the cell center above OBL_depth (ktup) and the cell interface above OBL_depth(kwup).

DESCRIPTION:

Computes the turbulent velocity scales for momentum (w_m) and scalars (w_s) given a 1d array of σ coordinates. Note that the turbulent scales are a continuous function, so there is no restriction to only evaluating this routine at interfaces or cell centers. Also, if $\sigma > \text{surf_layer_ext}$ (which is typically 0.1), w_m and w_s will be evaluated at the latter value.

DESCRIPTION:

Computes the square of the unresolved shear (V_t^2 in Eq. (23) of LMD94) at cell centers. Note that you must provide either the buoyancy frequency or its square at cell interfaces, this routine by default will use the lower cell interface value as the cell center, but you can instead take an average of the top and bottom interface values by setting `lavg_N_or_Nsqr = .true.` in `cvmix_kpp_init()`. 8.19 cvmix_kpp_compute_shape_function_coeffs

INTERFACE

```

subroutine cvmix_kpp_compute_shape_function_coeffs(GAT1, DGAT1, coeffs)

```

DESCRIPTION:

Computes the coefficients of the shape function $G(\sigma) = a_0 + a_1\sigma + a_2\sigma^2 + a_3\sigma^3$, where

$$\begin{aligned}
 a_0 &= 0 \\
 a_1 &= 1 \\
 a_2 &= 3G(1) - G'(1) - 2 \\
 a_3 &= -2G(1) + G'(1) + 1
 \end{aligned}$$

Note that $G(1)$ and $G'(1)$ come from Eq. (18) in Large, et al., and this routine returns $\text{coeffs}(1:4) = (/a_0, a_1, a_2, a_3/)$

USES

Only those used by entire module.

INPUT PARAMETERS

```

real(cvmix_r8), intent(in) :: GAT1 ! G(1)
real(cvmix_r8), intent(in) :: DGAT1 ! G'(1)

```

OUTPUT PARAMETERS

```
